

# AgStudio/AgDirector 2021 Version 25.3

May 6, 2021

## Release Notes

### *Enhancements*

- ⌘ Improved the warning in the Spatial FieldOps Linker to clarify that deleting unlinked regions also deletes associated linked regions in the same load.
- ⌘ Added the “Correct Source Units” toolbar option in the FieldOps Resource Linker extension to assign units of measure to application or planting data with missing or incorrect units.
- ⌘ Updated the application to support lbs/acre for GS4 aircart planting data, which now correctly displays the units in the Theme and on various Seeding reports.

### *Bug Fixes*

- ⌘ Fixed issue calculating crop health index values for satellite imagery composites.
- ⌘ Resolved error that occurs when Spatial FieldOps Linker is left open while changing growers.
- ⌘ Corrected an issue in Write Setup Cards that caused the export to fail if any product mix was active. Setup cards can now be exported regardless of having active or inactive product mixes in the database.
- ⌘ Resolved a bug in Advanced Multi-Year Yield Analysis that caused the last commodity/year selected in the grid to be ignored in the analysis.
- ⌘ Removed resources for the beta programs APPA and online Resource Linker.
- ⌘ Eliminated duplicate Precision Planting Shapefile writers in export windows such as VRF Export. There is now once again one option, as expected.

### *Card Manager Updates*

- ⌘ Fixed single user issue of Climate silage data showing inflated yield values.
  - ⌘ Fixed issue where the monitor name was missing from some machine data imports.
  - ⌘ Corrected issue where duplicate products were getting exported when using the Ag Leader Versa export.
-
